

Team: Varun Venkatadri, Abrar Ferdous

We have coded a simple calculator. The calculator takes in two float inputs and produces a float result. The available operations are addition, subtraction, multiplication and division.

There are 2 versions provided. One version does not follow the following principles:

- 1) DRY (certain lines are repeated multiple times)
- 2) Single Responsibility (there is only one function that handles everything)
- 3) The code is not self-documented (there are no comments or type hints anywhere )

This version is in the file `bad_version.py`. There is a version of the code that follows all these principles in the file `good_version.py`.
